Manmal. / X:O-V(L3Y0).

-1- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

-1- COPACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN (BY SIMILARITY).

-1- SUBMIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-1- SIMILARITY: BELONGS TO THE CYTOCHROME B/B6 FAMILY.

COMPLEX (COMPLEX II OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
C1-COPACTOR: TWO HEME GROUPS (BSZ AND BSS6) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).
C1-COPACTOR: THE MAIN SUBMITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
C1-SIBUNIT: THE MAIN SUBMITS OF COMPLEX B-C3
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).
C1-SIMILARITY: BELONGS TO THE CYTOCHROME B/B6 FAMILY.
REMBL: AF089009; AFF02229.1.

"A molecular phylogeny of ground squirrels and prairie dogs.";
Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.
-!- EUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAN GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).
-!- COFACTOR: TWO HEME GROUPS (B562 AND B566) WHICH ARE NOT COVALENTLY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Buğlenozoa; Kinetoplastida; Trypanosomatidae; Leishmania.

-!- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,

CYTOCHROME IL AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B/B6 FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a new phospholipase peptide fragment, from strain CBS 648.91 of a Hyphozyma. The phospholipase can hydrolyse both fatty acyl groups in a phospholipid (PL), has an optimum temperature about 50 degrees Celsius (measured for 10 min at pH 34) and optimum pH about 3 (measured at 40 degrees Celsius for 10 min). The phospholipase is used to hydrolyse acyl groups in (lyso)PL, particularly (lyso)lecithin. Specifically it is used: (a) to improve filterability of aqueous solutions or slurines of carbohydrate origin (especially wheat starch hydrolysate) containing PL; (b) in breadmaking (added to the dough) to improve elasticity; and (c) to reduce PL content (degum) in edible oils. The phospholipase lacks lipase activity and is effective at very low PH, so does not cause enzymatic/alkaline hydrolysis of triglycerides. It is not membrane bound so can be produced and purified on a commercial
                                                                                                                                                                                                                                                                                                                                                                    ;

AAY40001-92 are derived from human secreted proteins. The

polynucleotides and their corresponding secreted polypeptides are useful

for preventing, treating or ameliorating medical conditions, e.g. by

protein or gene therapy. Pathological conditions can also be diagnosed by

determining the amount of the new polypeptides in a sample or by

cetermining the presence of mutations in the polynucleotide. Specific

uses include developing products for the diagnosis or treatment of

cancer, tumors, neurodegenerative disorders, developmental abnormalities

and fetal deficiencies, blood disorders, sepsis, diseases of the immune

system, autoimmune diseases, inflammation, allergies, Alzheimer's and

cognitive disorders, schizophrenia, obesity, osteoporosis, arthritis,

infections, AlDS, connective tissue disorders, transplant rejection,

diabetes, asthma, sepsis, acne, psoriasis, cardiovascular disorders,

and reproductive disorders. The polypeptides or polynucleotides can

also be used as food additives or preservatives, such as to increase

or decrease storage capabilities, if at content, lipid, protein,

carbohydiate, vitamins, minerals, cofactors or other nutritional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

                                                                                                                                                                                                                           This sequence represents a Staphylococcus aureus protein of unknown function, and is encoded by a DNA sequence of the invention. The DNA sequences of the invention. The DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, contral nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; secreted protein; EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytckine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemocactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.

                                                                                                                                                      AAX51459 to AAX51691 represent 5' expressed sequence tags (ESTs) for human secreted proteins, and encode the proteins given in AAY12681 to AAY12913, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They proteins obtained may have cytokine activity, cell products and therapy. The proliferation/differentiation activity, hemmatopolesis regulating activity, tissue growth regulating activity, rememberatic/ chemokinetic activity, hemmatory activity, receptor/ ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forenace, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                        New nucleic acids encoding human secreted proteins - obtained from cDNA libraries derived from testis, ovary, uterus and spleen tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; colon cancer; colon cancer antigen; diagnosis; detection;

                                                                                                                                                                                                                                                                                                                              0
                                                       therapy and vaccine production. N and P may be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                     AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon

                                                                                                                                                                                                                                                                                                                                       immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to traet diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system disease, such as Alzheimer's Parkinson's disease, Huntington's disease, amportophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antiallergic; antiasthmatic; nootropic; neuroprotective; anticonvulsant; vulnerary; asthma; inflammation; allergy; Chôdiak Higashi syndrome; CHS; Alzheimer's disease; Parkinson's disease; Huntington's disease; diabetes; digestion disorder; wound healing disorder; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exocytosis pathway protein; Exo protein; antiparkinsonian; antidiabetic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a polypeptide which is associated with the exceytosis pathway. CDNA molecules encoding proteins involved in execytosis have been isolated by yeast one-hybrid and two-hybrid creening. Novel proteins, termed Exc proteins, have been identified that interact with known exocytosis-associated proteins such as GS27, alpha snap, uncia-1, vamp3, snap-23, and the rab family of proteins.

Exc proteins and their agonists and antagonists are useful in the diagnosis, treatment or prevention of exocytosis-mediated disorders cuch as asthma, inflammation, allergies, Chediak-Higashi Syndrome (CHS), Alzheimer's disease, Parkinson's disease, Huntington's disease, The nucleic acids, antagonists or agonists of Exc proteins are useful in gene therapy. The nucleic acids are also useful for generating transgenic or knock-out animals which can be used in the care of the companion of therapeutically useful reagents.

This sequence is a H. pylori cytoplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial by machine and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be production H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                               Helicobacter pylor1 nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylor1 infection, and to detect Helicobacter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Transmembrane; cytoplasmic; cell envelope; flagella; transport; secreted; periplasmic; chronic gastritis; duodenal ulcer disease; activator; inhibitor; bacterial life cycle; vaccine; immunise; detection; antisense; inhibition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then
                                                                                                                                                                                          Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H. pylori or for use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA mass isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The ORF/protein reference number for this sequence was obtained from the related specification, WO9640893.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have expostatic, cardiacative, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, culnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, and treatment and diagnosis of colon disorders, such as colon cancer. The colon disorders, such as colon cancer. The colon disorders and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune diseases, and cardiovascular disorders, renal disorders, infectious diseases, and cardiovascular disorders, renal disorders, infectious diseases, and cardiovascular disorders and the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autolmmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

```
represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively.

AAB6323 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic accids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Staphylococcus aureus protein; ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - used to isolate antimicrobial compounds, and in vaccines against S. aureus infection

AAB63232 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human prostate cancer associated antigen protein sequence SEQ ID NO:1153.
                                           The present sequence represents a Staphylococcus aureus protein, that, based on homology with an E. coli protein, is believed to be an enoy1-acyl carrier protein. The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              encoding breast, gastric and prostate cancer associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is an olfactory receptor which is encoded by one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory
acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                             Gaps

                                        S
                                                          a
                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/Ainhibin activity, cancer diagnosis and therapy, drug screening, assays, for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed

The present sequence is a polypeptide from the human olfactory receptor data exploratorium (HORDE). It was used as a query sequence in a database search of olfactory receptor (OR)-like sequences. The invention relates to isolated polynucleotides encoding polypeptides involved in olfactory sensation. The polynucleotides can be used in screening for olfactory sensation. The polynucleotides can be used in screening for olfactory primary scents and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This chables the construction of a scent representation (also called a scent ingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present sequence is a polypeptide from the human olfactory receptor data exploratorium (HORDE). It was used as a query sequence in a database search of olfactory receptor (OR)-like sequences. The invention relates to isolated polynucleotides encoding polypeptides involved in olfactory sensation. The polynucleotides can be used in screening for olfactory sensation. The polynucleotides can be used in screening for olfactory primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of cetect these primary scents. The methods also enable determination of cetect these primary scents. The methods also enable determination of cetect these primary scents. The methods also enable determination of secondary scents are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent ingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different
                                                                                                                                                                                                           Human olfactory receptor data exploratorium sequence, SEQ ID NO: 2434.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides which encode polypeptides involved in olfactory

```
human genes. The genes and their corresponding secreted by the 97 human genes. The genes and their corresponding secreted by the 97 human genes. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliocrating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developing products for the and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ65250 to AAZ65350 represent 97 isolated human secreted protein genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disorders, schizophrenia, arthritis, asthma, psoriasis, sepsis, skin disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners. The sequences shown in AAY76224 to AAY76424 represent fragments of the
                                                                                                                                                                                                                                                                                                                                                                              New isolated human genes and the secreted polypeptides they encode, useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 11; Page 358-359; 475pp; English.

```
The invention relates to an isolated transcription factor gene which is expressed in a recombinant maturing dicot seed and which encodes a transcription factor protein which targets a promoter of a gene encoding seed storage proteins, lectins or oil-body proteins. The transcription factors isolated are Pv-Seed factor-1 (ROM1) and Vicilin-box binding protein-1 (ROM2). These factors bind to 7S-globulin (b-phaseolin) or lectin (PHA-L) promoters. The transcription factor gene is useful for enhancing or reducing expression of seed storage protein, lectin or oil-protein genes in dicot seed crops. The present sequence represents the amino acid sequence of bZIP2 (basic leucine zipper) ORF2 protein.
protein that targets promoters of genes encoding seed storage proteins are useful for modulating seed storage protein expression in dicot seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Brevican; chrondroitin sulphate proteoglycan; glial cell; axon; neurofibromatosis; gliosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Location/Qualifiers

                                                                                                                                                                                                                                                                                                         The present sequence represents a consensus sequence between human papillomavirus type 11 (HPV11) and HPV6b. The specification decribes a synthetic HPV16 virus-like particle (VLP) which contains a Glu substitution for the naturally occurring Asp at position 202. The protein is designated HPV16bd202E. The novel VLP HPV:D202E binds H16.44 antibody but not H16.V5 antibody and thus allows specific identification of HPV16 types. The new VLPs are used in the characterisation of HPV type 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transcription factor; seed storage protein; lectin; oil-body protein; Pv-Seed factor-1; ROM1; Vicilin-box binding protein-1; ROM2; 7S-globulin; phaseolin; PHA-L; bean; nuclear protein; promoter; ORF; bZIP; basic leucine zipper.

The fraction containing the core protein was purified and the sequences of the N-terminus and internal tryptic peptides were detd., giving the sequence shown in AAR85443. Brevican is used to modulate axonal growth and to raise antibodies useful for detecting gliosis.

(see AAX35612) of the invention. Amino acid sequences deduced from reading frames 2 and invention. Amino acid sequences deduced from reading frames 2 and invention provides isolated DNA molecules which are differentially cuprention provides isolated DNA molecules which are differentially expressed during banna fruit development, and the protein products of these genes. The DNA is selected from a group comprising starch synthase, chiltinase, endochiltinase, beta-1,3-glucanase, starthase, modechiltinase, metallothionein, lectin and senescence-related protein. The regulatory elements of the genes can be used to produce chimeric genes for transformation of plants to provide controlled expression of heterologous DNA during fruit development, or in response to exogenous developmental signals, such as sthylene signals. The heterologous protein, e.g. a therapeutic protein, can be isolated from the fruit or consumed directly in the transformed fruit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

(see AAX25613) of the invention. Amino acid sequences deduced from reading frames 2 and invention. Amino acid sequences deduced from reading frames 2 and invention. Amino acid sequences deduced from reading frames 2 and invention provides isolated DNA molecules which are differentially expressed during banana fruit development, and the protein products of these genes. The DNA is selected from a group comprising starch synthase, chitinase, endochitinase, beta-1,3-glucanase, thaumatin-like protein, ascorbate peroxidase, metallothionein, the genes can be used to produce chimeric genes for transformation of plants to provide controlled expression of heterologous DNA during fruit development, or in response to exogenous developmental signals, such as ethylene signals. The heterologous protein, e.g. a therapeutic protein, can be isolated from the fruit or consumed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                    Score

Fujimoto K., Ohta N., Yoshida M., Kubota I., Muneoka Y., Kobayashi
"A novel cardio-excitatory peptide isolated from the atria of the
African giant snail, Achatina fulica.";

Biochem. Biophys. Rcs. Commun. 167:777-783(1990).

-i- FUNCTION: POTENTIATES THE BEAT OF THE VENTRICLE, AND HAS ALSO
EXCITATORY ACTIONS ON THE PENIS RETRACTOR MUSCLE, THE BUCCAL
MUSCLE AND THE IDENTIFIED NEURONS CONTROLLING THE BUCCAL MUSCLE.
